First edition: August 2013
Reprinted: May 2014
Revised: April 2015
Staying physically active is the single most important thing we can do to stay fit and independent.

As we grow older we lose muscle strength and sense of balance and this can lead to a fall. The more active we remain, the better the chance of keeping our muscles strong, our joints mobile and maintaining good balance.

Staying active reduces our risk of a fall, which helps keep us independent and improves our overall health and wellbeing.

How much activity is enough? At least 30 minutes a day, 5 days a week, is recommended. The exercise should be brisk enough to increase your breathing and heart rate, although it doesn’t have to be so hard that you can’t talk.

Activities to get your heart rate up and help build fitness include:

- aqua aerobics
- brisk walking
- golf
- group exercise classes
- swimming.

To reduce your risk of falling, it’s also important to include activities that improve your balance and increase your strength. Try to include these into your routine every day.
Activities which are particularly good for balance and strength include:

- dancing
- gym sessions
- group exercise classes
- home exercises
- lawn bowls
- pilates
- Tai Chi
- yoga.

These types of activity have plenty of benefits. They help keep your heart strong, your blood pressure down, and control your weight. By improving your balance and strength, you reduce your risk of falling and causing an injury or breaking a bone. And they keep you active enough to do the things you want to do, whether that be getting out of the chair easily or maintaining the garden.

Try to mix up the activities — this will exercise different muscles and helps keep you interested. You don’t have to do it all in one go — being active in 10-15 minute slots during the day works just as well.

Age is no barrier — research shows that any exercise, at any age, is worth the effort. If you are in any doubt about exercises, please talk to your doctor.
Staying physically active is the single most important thing we can do to stay well and independent.

Exercise at home

The following balance and strength exercises are easy to do at home. Make sure you have a chair, benchtop or wall nearby for support when you try them. Once you become more confident, you can hold for longer or increase the number of repetitions. Use smooth movements when performing these exercises and take your time. Stop exercising if you experience any unusual pain or discomfort and seek advice from a qualified health professional.

1. Heel to toe standing / walking

- Helps keep balance when you have to walk through a narrow space
- With fingertips on something solid to help balance, stand heel to toe, bend your knees slightly and keep still for 10 seconds.
- Vary the exercise with feet close together and one foot halfway in front of the other.
- Upgrade the exercise by walking slowly, placing your heel to touch the toe of the other foot.

2. Knee raises

- Helps with climbing stairs and getting in and out of cars and buses
- With fingertips on something solid to help balance, lift a knee to hip level and hold it for 5 seconds.
- Repeat with the other leg.
- Then repeat 8 times.

3. Side leg raise / sideways walking

- Improves stability when you have to take weight on one leg, and helps you step sideways to avoid tripping
- With fingertips on something solid to help balance, stand on one leg and raise the other sideways, holding it for 5 seconds.
- Repeat 8 times.
- Then do it with the other leg.
- Extend to walking sideways with slow steps alongside a bench or table.

Exercise at home
4. Heel raise

- Helps with walking and climbing stairs
- With fingertips on something solid to help balance, lift both heels off the floor and stand on your toes for 3 seconds, then slowly lower your heels to the floor.
- Repeat 5 times.

5. Stepping up a step

- Improves stability on steps, paths and uneven surfaces
- Holding onto a rail, go up and down a single step.
- Repeat 5 times.

6. Sit to stand

- Helps with getting up and down from a chair or toilet, and in and out of the car
- Stand up slowly from a chair, keeping your knees slightly apart. To make it harder, cross your arms in front of your chest or hold them out in front of you at shoulder height.
- Then lower yourself back down into the chair.
- Repeat 5 times.
- If this is too strong for your knees, start off using a chair with armrests to push off from.
Many people don’t get enough calcium or vitamin D. Talk to your doctor about your calcium intake and Vitamin D level.
The following menu is an example of a typical day’s eating that would help you reach the recommended intake of calcium (1300 mg per day).

**Breakfast:** Toast or muesli plus a tub of low fat yoghurt

**Lunch:** Wholemeal sandwich with cheese, chicken and salad

**Dinner:** Pasta or rice with tinned salmon or tuna and vegetables such as peas, broccoli and carrots

Snacking on fresh or dried fruit, cheese, and nuts and a glass of milk/soy milk each day will make up the rest. Calcium-enriched breads, juice and milk can be good sources for additional calcium.

You get vitamin D in two ways — from your diet and from sunlight.

Vitamin D is found only in certain foods. These are:

- milk
- oily fish such as salmon and mackerel
- eggs.

Sunlight is another way of getting vitamin D. Sunlight acts on the skin and converts it to vitamin D. 6-8 minutes in summer and 13-16 minutes in winter is enough.

For more information about the importance of vitamin D visit: [www.osteoporosis.org.au/vitamin-d](http://www.osteoporosis.org.au/vitamin-d)

**Vitamin D and sunlight**

Vitamin D is very important for strong bones. Being low in vitamin D can affect your muscle strength and play a part in causing osteoporosis because without it calcium won’t be fully absorbed by your bones.

**Water**

Many people don’t drink enough water. Lack of water can lead to dehydration, weakness and dizziness, and is a common cause of older people falling and hurting themselves.

**Drink at least 6 glasses of fluid a day, preferably water.**
Staying active and on your feet

Have regular check-ups and ask your health professional for advice on activities to improve balance and strength.

Your health

A number of health conditions can affect your ability to move around or make you feel unsteady on your feet. These conditions include arthritis, osteoporosis, diabetes, heart problems, breathing problems, depression, Parkinson’s disease and dementia.

These conditions may increase the risk of losing your balance, tripping and falling. Even short-term illnesses (such as the flu or other infections) can affect your stability.

Have regular check-ups and talk to your health professional for advice on how these conditions might affect you. You can also get advice on activities you can safely do to regain balance, strength and confidence.

Mobility and walking aids

A walking aid may help improve your safety and mobility.

If you think that this would benefit you, talk to a health professional such as a physiotherapist or occupational therapist. They will be able to suggest the most suitable aid for you and show you how to use the aid safely and confidently.

If you do use a walking aid at home, you might need to rearrange your furniture so that you can move around easily.
**Eyesight**

Our eyes change rapidly as we age, and it becomes more difficult to judge distances, cope with glare and adjust to sudden changes in light. This can affect your ability to see the edges of steps and stairs.

Bifocal, trifocal or multifocal glasses increase the chances of falling, as the changes in the lens can make it difficult to judge distances and to see uneven footpaths and the edges of steps and stairs.

Other eye conditions, such as macular degeneration, glaucoma, cataracts, and diabetic retinopathy, impair vision. They may require you to learn new skills to move around safely.

Have your eyes checked by an optometrist or ophthalmologist at least every two years, and by your doctor in the years between.

Consider having a separate pair of glasses for walking outdoors.

Give your eyes time to adjust to sudden changes in light, and ensure that you have good lighting at home and on stairs.

If you get new glasses or any treatment for your eyes, be especially careful. You will need to allow your eyesight time to adjust.

**Footwear**

Healthy feet and well-fitted footwear help reduce your chances of tripping and falling.

As we age, our feet can change shape and lose some feeling and flexibility. This changes the way we walk and affects balance. See your doctor or a podiatrist, if you have painful or swollen feet.

Keep your feet healthy by keeping nails trimmed and getting treatment for bunions, corns and calluses.
Some medicines—whether they are prescription medicines or those bought without prescription—can make you dizzy or drowsy. This can predispose you to falling over.

The medicines that make falls more likely include those for:

- anxiety
- depression
- sleeping difficulties.

People who take four or more medicines a day are at particularly high risk of falling.

**Tips**

- Make a list of every medicine you take, and take it with you when you go to see a doctor or pharmacist. This list should include any herbs, tablets or supplements you buy from a health food store or from the health food section of the supermarket, as well as any medicines you buy from a pharmacy.

Talk to your doctor about your current medications and whether there are any that could be discontinued.

For a list of questions you may like to ask your doctor or pharmacist visit the National Prescribing Service website:

[www.nps.org.au](http://www.nps.org.au)
• Ask your doctor to review this list thoroughly. Doing this every 6 months is a good idea if you take four or more medicines a day. Otherwise, once a year is enough.

• If you find it difficult to remember which medications you take and when to take them, ask your pharmacist or doctor about devices that may help such as pill boxes or Webster-paks®.

• If you feel dizzy or find it hard to concentrate, contact your doctor or pharmacist straight away.

• If you take anticoagulant medicines (blood-thinners), you should always see a doctor if you have a fall, as you may be at risk of severe injury and bleeding.

• Avoid sleeping tablets if possible.

• Only take your own medicines and don’t use someone else’s, even if they are for the same condition.

Ways to improve your chances of a good night’s sleep:

• get into a good relaxing bedtime routine
• go to bed at about the same time each night
• get up at about the same time each day
• restrict alcohol, caffeine and smoking, which are all stimulants.
If you answer **Yes** to most of these questions, then you are doing well.

If you answer **No** or **Not always** or **Not sure** to more than one of the questions, then you may be at risk of a fall. You might like to discuss this checklist during your next appointment with a health professional.

</tr>
</tbody>
</table>
It is important to have an emergency plan:

• know who to call for help — you could keep a list of the phone numbers of family or friends near the phone, or program them into the phone for one-touch dialling

• have a phone within reach on a low table, in case it is hard to get up

• protect yourself by considering whether you would want a device that raises an alarm in case of emergency

• let trusted family and friends know how to get into your house if you can’t let them in.

The following technique for getting up if you do fall is worth knowing:

1. Roll onto your side
If you can’t bend your knees very well, slide along on your bottom then lift your hips onto something higher, such as stairs. Then you can pull yourself upright again.

You might even like to practise these techniques so that if you ever need to get up from the floor, you will feel more confident.

You should see your doctor after a fall if:

- you are taking anticoagulant medicines
- you bump your head and feel drowsy or unwell afterwards
- you have a pain that concerns you
- you are worried about being unsteady, or falling again.
Staying physically active is the single most important thing we can do to stay well and independent.

About half of all falls occur in and around the home. You can reduce your chances of having a fall at home by making sure that you have followed some basic home safety guidelines.

This checklist will help you identify aspects of your home that might increase your risk of a fall. Walk around each room and check that there is nothing that might pose a risk. For small safety improvements, see if a family member, friend or local handyperson can help you fix the problem. A health professional can also arrange for an occupational therapist to perform a home safety assessment and arrange for installation of home modifications.

### Entrance and hallway

| Light switches easy to reach and near each doorway or hallway |   |
| Doorbell easy to hear from other rooms |   |
| Rugs or mats with slip-resistant backing |   |

### Stairs and steps

| Light switch at both the top and bottom of stairways |   |
| Stairs and steps well lit |   |
| Carpets or runners securely fixed |   |
| Sturdy handrail |   |
| Edges of steps clearly marked |   |
| Non-skid treads or paint used on the edges of each step |   |

### Kitchen

<p>| Regularly used items within easy reach without climbing or bending |   |
| Good lighting over benchtops and other work areas |   |
| Good ventilation to reduce the risk of glasses fogging |   |
| Floor surfaces slip resistant |   |
| Spills cleaned up straight away |   |
| Sturdy low step stool with handrail if need to use higher shelves |   |</p>

Fall-proof yourself

Q. Are you active and on your feet?
Being physically active is important to stay well, independent and to do everyday tasks.

Q. Is your vision changing?
As we grow older our vision changes. We do not see as clearly, are less able to judge distance and depth, and adjust to sudden changes in light.

Q. Are you taking medications?
Some medicines can increase your risk of falls, especially those taken for anxiety, depression or difficulty sleeping. Medication may make you feel drowsy, unsteady, dizzy or confused.

Q. Are your feet sore?
Feet can change shape and lose some feeling. Painful and swollen feet make it difficult to walk and some shoes or slippers may cause you to stumble or trip.

Q. Are you deficient in Vitamin D?
Being deficient in Vitamin D can affect your bone and muscle strength as this vitamin helps our bodies to absorb calcium from food.

Do balance and strength exercises
Have your eyes checked
Talk to your doctor
Have your feet checked and wear comfortable, firm-fitting, flat shoes
Talk to your doctor
